Mercury McLeod Vacuum Gauge UVG-1 & UVG-2

UVS Industry standard Mercury McLeod Gauge is a precision instrument used to measure vacuum measurements up to 0.001 mm of Hg.
It operates using a mercury column on a calibrated scale, mounted on a metal base structure. They work on Boyle's Law, compressing a gas sample to calculate pressure, and come in glass with mercury, often with ranges like 10 to 0.001 mmHg, used in labs, pharma, and chemical industries for accurate readings.

UVG-1 measures vacuum from 10 to 0.01mm of Hg
UVG-2 measures vacuum from 1 to 0.001 mm of Hg.

- These McLeod vacuum gagues are typically made of glass, featuring a capillary tube, a bulb, and a mercury reservoir, often with a stand for stability.
- This gauge readings can be obtained by tilting the scale to 90° effortlessly.
- It is a primary standard vacuum gauge, meaning it measures pressure based on physical principles and does not require calibration against another device.

These Gauges are supplied with first charge of high purity tripple distilled mercury.

TECHNICAL SPECIFICATIONS

Vacuum Gauge	***Mercury McLeod vacuum gauge***
Features	Graduated scale, Readings obtained by tilting the scle by 90°
Measuring Range	UVG-1 (1 to 0.001 mm of Hg) UVG-2 (10 to 0.01 mm of Hg)
Overall Dimension of the Gauge (excluding stand)	180mm X 115mm X 35mm
Mercury	High purity Tripple disptilled
