

Vacuum Gauge Calibration Services

Pressure & vacuum monitoring comes with unique safety, compliance and maintenance demands. That's why **Unique Vacuum Solutions** wants to ensure that you have expertly calibrated equipment. At our works, we perform vacuum gauge calibrations to support critical objectives – from safeguarding product stability to ensuring research validity. Our talented experts have the knowledge to conduct ultra-accurate calibrations so your process vacuum equipment delivers the precision you need.

Calibrate Vacuum Gauges for High Performance

- Ensure production quality or pinpoint issues in production.
- Receive correct gauge readings that contribute to uptime and safety.
- Keep equipment certifications up to date in regulated environments.
- Depend on accurate instruments during monitoring or testing.
- Prepare newly purchased devices for duty and verify application compatibility.
- Identify and correct equipment errors – before services and processes are impacted.

Why Choose Unique Vacuum Solutions Calibration?

Our extensive [vacuum calibration services](#) include evaluating devices that report vacuum, absolute and gauge measurements. Zero and span adjustments where ever necessary in consultation with customer. We calibrate all types of vacuum measurement instrument, including [digital and analog vacuum gauges](#) :

- Capacitance manometers from full scale range 1 torr, 1mbar to 1000 mbar.
- Pirani vacuum measurement gauges: range $10e^{-4}$ mbar to 1000 mbar.
- Cold cathode vacuum gauges: $10e^{-2}$ mbar to $10e^{-6}$ mbar range.
- Hand held battery operated refrigeration vacuum gauges.

Unique vacuum solutions will work with customer to establish a schedule for each vacuum measurement device that requires recalibration. We can then provide timely onsite vacuum calibration services.

Job execution:

Unique Vacuum Solutions has trained and expert calibration staff who carry the master reference vacuum gauge along with the high vacuum simulation system to the customer site.

The master calibration references:

- for medium vacuum range up to 1 micro bar or 0.001 mbar will be capacitance manometer.
- for high vacuum measurement from 0.01 mbar to $10e^{-6}$ mbar the master will be the full range gauges.
- All the masters will have the valid NPL or NIST traceable certificates.

Rapid turn around time all over india to attend the onsite calibration.

The calibration procedure and master calibration reference certificates will be submitted prior to the commencement of the calibration.

The procedure : The INSTRUMENT UNDER CALIBRATION (IUC) is assembled along the master gauge on to the calibration system

The system will have a built in high vacuum measurement instrument to ensure the ultimate base pressure.

- 1) *The required reference instruments, vacuum simulation system with all vacuum connections and fittings will be brought by UVS engineer.*
- 2) *We shall submit the calibration report of the vacuum gauge upon completion of the calibration.*
- 3) *raw data preparation at the time of calibration.*
- 4) *Submitting the copy of service report, raw data and calibration reports along with master traceability to customer.*
